

Systems Definition, Inc. (SDI) developed the EasyStaff™ software application to enable Fire Operations personnel to quickly and easily fill out tour rosters and to define radio identification data to support safety and accountability efforts. The application is easy-to-use software refined for real-world use, honed from lessons learned building accountability applications for New York City Fire Department (FDNY). These applications support one of the largest fire departments in the world with high-value user capabilities.

Derived from SDI's innovative software for the FDNY's Electronic Battalion Form 4 (EBF-4) ride list application, EasyStaff enables rapid and accurate roster preparation and streamlined reporting. EasyStaff links Unit, assignment, personnel, and radio identification information, by tour, to support fireground safety and accountability activities. Features include streamlined spare radio management to ensure identification accuracy when spare radios are used in the field.

EasyStaff readily integrates into daily Fire Operations, and is a valuable tool geared for Operations personnel closest to the action. Data collected in EasyStaff can be output directly to the fireground to support identification for rollcalls and emergency alerting. EasyStaff can play an important role contributing to Department efforts to implement a modern and comprehensive accountability system.

Features • Benefits

- Built for Fire Operations personnel to easily and rapidly prepare tour rosters from a browser on any network-connected computer. The friendly design lets Fire Operations personnel enter data directly without administrative levels in the loop and can even be used at incidents to update personnel changes as operations proceed.
- Ensures accurate data for Operations safety and accountability on the fireground by focusing on "who is working" and not
 "who should be working". EasyStaff lets Fire Operations personnel easily develop accurate tour data independent of staffing applications that are geared more toward administrative functions such as timecards, payroll, and vacation planning.
- Saves time and eliminates paper-based forms or inaccurate/inaccessible station chalkboards. EasyStaff is built for Fire Operations personnel for safety and accountability activities. Roster staffing can be viewed anywhere from a web browser at any organizational level (e.g., Unit, Battalion) for streamlined accountability.
- Stores and updates radio identification data, including provisions for spares and spare radio loaning. Links Unit assignment and personnel name to hand-held radios, SCBA devices, or other assets, by tour. Integrates into a comprehensive fireground solution by automatically sending roster/ID data to SDI's APXTM Personnel Accountability Application (APAA) accountability software (available separately) to support emergency alerting, rollcall, and other accountability features.

APX is trademark of Motorola Trademark Holdings, LLC. EasyStaff is a trademark of Systems Definition, Inc.
